

IN THE PERFECT SAFETY of A GREAT FLOOD of LIGHT

WITHOUT LEAVING YOUR CAR

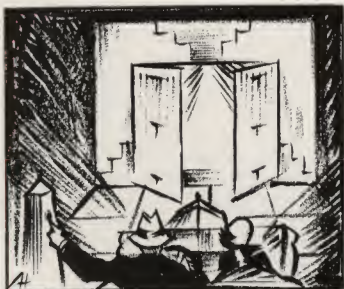

*You* **Open the Doors** *and the* Garage  
*and* Areaway are **Flooded with Light**

*for Safety~  
Light*

*Convenience~  
Just Turn a Key*

# Here's the way it Electrically Operates

When you drive up to your home, you can enter securely.

Only 2 persons can operate the garage.

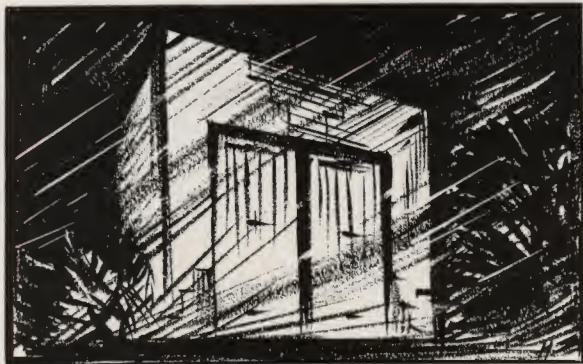

You can open them by the key switch lock without getting out of the car.

Or your wife or other member of the family can open them by pressing the control switch.

The instant the key switch in the house is touched, the garage is filled with light, and the doors automatically close and you are in perfect safety.

You drive your car into the garage, walk in the light to your home, and when you press the control switch, the garage doors close and you are away in the perfect safety of your home. You have done it comfortably and with no annoyance.

# Make Your Garage Doors Automatic for Greater Safety—Greater Convenience

## The GENERAL POWER DOOR UNIT

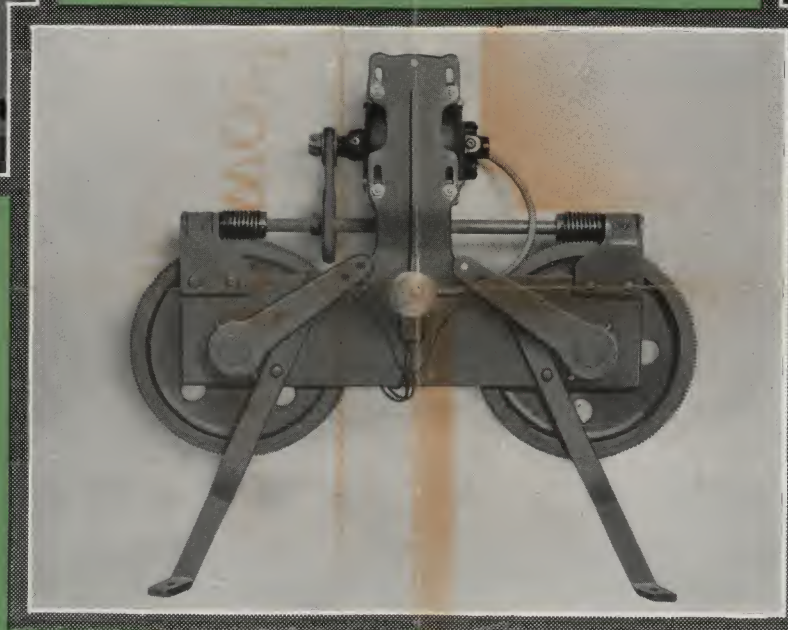

### Quickly and Easily Installed in Most Any Garage

**T**HE General Power Door Unit, operated by electricity, opens, closes and locks the garage doors. It is so designed that it can be installed on almost any kind of garage door. We have seldom encountered a garage where the doors had to be altered to accommodate the unit.

You can understand how simple installation is when you know that installation is merely the application of electrically operated steel arms to the job of opening and closing the doors. The usual installation carries a three station control system—a push button within the garage—one within the house and one at the key-lock switch outside the garage.

Wires to the key-lock switch are laid under ground, run up through a post to a Yale lock. The only way that thieves could effect an entrance would be to batter down the door.

Your interest as to the cost of this equipment applied to your garage can be satisfied quickly. A phone call or a postcard will bring you the information you want.

### Unfailing in Performance

You can believe that headline, because the General Power Door Operating Unit is made of exceptionally strong materials. Its mechanical construction is simple. There is nothing to get out of order. The only attention it requires is an annual greasing. Strong steel arms open, shut and lock the doors. The arms are operated by worm gears. These gears run in oil; they are housed and sealed as completely as the differential of an automobile. The gears are operated by an electric motor. The belt drive eliminates the danger of a burned out motor. Another feature of the belt drive is that anyone can hold the doors while they are opening or closing. This eliminates every possibility of injury.

Here is a unit that is so simply and carefully made, out of extra wear resisting equipment that it will last for many, many years without repair costs.

### It Takes Only Once to be Sorry

**A** DARK garage at midnight is no place for either yourself or your family to get out of your car. Prowlers, robbers, hold-up men are waiting for just such opportunities (darkness—the surprise attack—neighbors asleep) to attack and plunder.

The General Power Door gives you much more than convenience and comfort—it gives you absolute protection against surprise attack—safety for yourself and family. Because you can open the doors, flood the garage and area-way with light, while you sit in the perfect safety of your car with the engine running.

And when you leave the garage, you don't turn out the lights. You walk to the house protected by light. And once in the house you press the control button. The doors are closed and locked. The lights are out.

Protection such as this for yourself and your family should be installed at once.
